---

I was thinking if we have to dispose of this material and we pull it out in a slurry it would carry a D002 code because it will have a pH of 14. We plan on trying to get it out in the solid form so it would not normally carry a code. Then if we are able to give this material to U.S. Lime then my hopes are we would give it to them for reuse and it would be handled on a Bill of Lading as a product. Are there any variances should we have to dispose for any reason to negate the D002 Code?

Thanks
